

CLIMATE CHANGE – USA STYLE!?!®

by Dan Pemble, Kissimmee, Florida – December 13, 2021

At my age of 77, my true experiences in life have taught me a whole bunch – beyond anything you could read about in any text book or whatever “scientific opinions” may be perpetuated these days in the media! Oh yes, as the title of this article suggests, I’m talking about the subject of “climate change”; so here I go!

Having lived in northwest Iowa during my formidable years, it was expected that each year there would eventually be some ‘brutal’ winter weather – almost on cue. Such brutality consisted of many blizzard-like conditions with heavy snowfalls and extremely cold weather which at times caused a total paralysis for all outdoor activity. Often, because of “mountains of snow”, schools were closed, people could not go to work, and all we could do is “hunker down” in the confines of our homes with the hope that we could stay warm! Climate change? Are you kidding? Such brutal winter weather was expected each year, as has been the case for many, many years before anyone had broached the subject and gone completely overboard about the subject of “climate change”!

Given the recurring severity of winter weather in the northern states in the USA, is it little wonder that those who have the means escape from this annual onslaught and temporarily move to southern states in the USA with much warmer and consistent winter weather patterns, once again as have persisted for many, many years! Those from the north who join this annual southward temporary migration are known as “snowbirds” to the folks who reside in the southern locations year around. So, to keep on the topic of this article, just as people who reside in the northern states in the USA have experienced harsh winters year after year, so too have the winters in the southern states been consistently warmer – year after year after year! I continue to be amazed with all the hype about “climate change” when in fact it is real, although it is a naturally recurring seasonal or periodic change in weather conditions just as it has persisted throughout the history of our planet!
