

“GLOBAL COOLING” IS COMING SOON!©

by Dan Pemble – Kissimmee, Florida – September 27, 2023

Just as we had been coached to believe that we were all to become “crispy critters” or drowning victims attributed to rising seas, as the world ended as a result of “Global Warming”, alas, along comes “Global Cooling”! Oh yes, the “Fall Equinox” did indeed arrive in the globe’s northern hemisphere on September 22, 2023, as it has arrived for centuries before! So, just to be clear about the definition of the fall equinox: it is the time of year when the hours of daylight and the hours of darkness are equal; thereafter, for a period up to December 21; each successive day has less daylight hours. All the seasons of the year are based on the tilt of the earth’s axis at the time and the direction and angle of the sun at which it strikes the earth. So, simply enough, as the angle of the sun as it strikes the earth becomes more indirect, so too does the warming effects of the sun diminish! Not a whole lot of “science” is required here! Less intense sunlight equates to less warmth from the sun. Of course beyond the influence of the sun on our 4 seasons of the year, there are other non-human-related naturally-recurring atmospheric phenomena far beyond our control that indeed can affect global temperatures.

Hey, I’m not sure about other global locations, but here in the normally-sizzling hot and humid area where I live in Florida, there is already evidence of “global cooling” going on! A prime example is the water temperature in my swimming pool. In the heart of our Florida summer, my 10,000 gallon pool water temperature was 92 degrees F., as warmed only by the sun. And now, as I write this, the temperature is just 80 F. Of course rainfall also influences the water temperature. In anticipation of this year’s global cooling and the need to keep warm, I am now “harvesting some added facial hair” – also known as growing a beard!

Interestingly enough, some influential “scientific types”, but not experts in the field of climatology, have recently voiced some common sense statements related to “global warming”. One well-known individual is among this group who are now professing some reality in the matter. This guy has often been outspoken in matters far beyond his technical savvy related to climate matters, but in a nutshell he has recently stated that there is no need for radicalism, hysteria, and “dooms-day scenarios” related to so-called global warming theories; it’s better to simply acknowledge that there will be some slightly rising global temperatures & related events; however, being adaptable as we are as humans, we’ll deal with it and it won’t be the end of the world! Of course the quest to deal with global pollutants will continue, but sensible and far less-expensive goals and realistic time lines need to be established. Let’s face it, to date all the wind turbine and solar panel emplacements, coal-fired electrical plants that have shut down throughout the globe, and other so-called “green” measures that have cost trillions have not had any noticeable effects on global temperatures at all! It just seems that errant policies being forced on humanity by panic-stricken and short-sighted governments have done little more than to “victimize” the world’s general populace!

There is no question that with the arrival of fall, winter, and spring there is indeed a period of “global cooling” – even if historical average seasonal temperatures are exceeded by a degree or 2!
