

## OH NO! HERE I GO AGAIN ABOUT CLIMATE CHANGE & GLOBAL WARMING!© by Dan Pemble, Klissimnee, Florida

*The very issue of climate change/global warming has become an increasingly-controlling factor in all of our daily lives (like the COVID saga)! Considering the fact that the entire subject continues to be controversial and not all that believable by many, it begs the question of exactly who is the ultimate expert (if any) on the subject! There are far too many non-experts (Al Gore comes to mind) who are only in it for commercial (money-making) opportunities! In my mind, far too many of those who are currently “preaching the gospel” are completely untrustworthy and are only contributing to the hysteria! So many non-experts, especially the ones exploiting doomsday scenarios, including many in our government, have saturated us with never-ending/questionable information and have victimized us to the point that we cannot think for ourselves. But, who am I – only 1 of many subjected to the continuing debate about all of this.*

There is certainly no argument that collectively the world has done and continues to do a thorough job in polluting our oceans, rivers, streams, and the very air that we breathe! There is much to be done, not only in the USA, but by world-wide countries in cleaning up our collective acts! The problem is, this cannot be accomplished in the unrealistic time that is being discussed and humans throughout the world should not be penalized by goals that cannot be met! Oh yes, politicians and others must necessarily be mindful that life must go on while certainly the world-wide goal is to reduce pollution, but in a reasonable future time period! Realistically, such time period is years away from the current projections!

As we continue to hear more often than we would like, CO<sub>2</sub> is one of the so-called “greenhouse” gases that is contributing to atmospheric pollution and supposedly to global warming! As I stated above, I don’t know (or trust) who the “supreme expert” is on the subject of climate change/global warming, so I have endeavored to ascertain some reasoning about this on my own! What I have found on numerous web sites are countless charts and graphs and words that seem to be quite consistent in showing that CO<sub>2</sub> concentrations in our atmosphere by themselves do not directly relate to increased temperatures throughout the planet! Of course this is opposite to all the “hot air” that is being blown by so many non-expert “green activists”. Following is one of many typical charts showing atmospheric CO<sub>2</sub> concentrations versus temperatures (and some periods of inverse relationships?)!

Did I “cherry pick” this graph? Maybe; I don’t recall its source! You may want to do your own research!
