

OH NO! Those “Pesky Cattle” Are At It Again!©

by Dan Pemble, Kissimmee, Florida – June 27, 2024

Hi! I was just wondering if you have seen the latest news about the catastrophic effects that cattle are continuing to contribute to our forever escalating climate change/global warming manifestations!? I must say that I am neither a denier nor a total believer in some of the climate change/global warming beliefs that have been put forth and have found that it is helpful to think logically and rationally in lieu of becoming a complete fanatic about any given subject! The problem is, once someone has become fanaticized, only “tunnel vision” will prevail! The following photo, as you have possibly seen on a web site, is just about as fanatical as it gets when considering the overall effects of cattle on climate change and global warming! I laughed out loud when I first saw it!

These daze, most all countries are caught up in trying to project intelligence and innovation in contributing their part in reducing the perils of climate change, particularly as related to atmospheric pollution. Certainly atmospheric pollution has been on the minds of many – even long before anyone ever mentioned the subjects of global warming & climate change! Of course some sources of human activity contribute more to this pollution than others and thus, efforts to reduce the pollution caused by the major contributors have been well underway for some past years and are continuing today. However, now there are increasingly more very questionable efforts by some to “pick fly specks out of the pepper” by honing in on the minor contributors to atmospheric pollution! So this brings me to the point of this article.

For those of us who read the news, we have recently seen that Denmark has proposed imposing a tax on livestock producers because of the “dastardly” effects their livestock are having on climate change due to their methane (“greenhouse gas”) emissions! According to the Associated Press: The proposed carbon tax – which still needs to be approved by the Danish parliament, would go into effect in 2030, when Denmark aims to reduce greenhouse gas emissions by 70% compared to 1990 levels. The U.N. Environment Program says methane is the second-biggest contributor to global warming, and the gas is released in part by farts, belches, and droppings from livestock such as cows and pigs.

The ridiculousness of all of this becomes even more so when I have read elsewhere that some have even proposed a type of bag or diaper to be affixed to livestock to collect their methane emissions! OH MY! What other total insanity is on the horizon!?

PLEASE! WHY ME? I MEAN NO HARM!

As always, I accept the fact that my beliefs may not be the same as yours. I do hope you find what I have to say to be of interest. I welcome any comments you may have and they can be e-mailed to me at: daniel8798@cfl.rr.com
